GridParity builds 712 kWp roof-mounted PV system on the Hansedom Hotel in Stralsund

The GridParity installation team was not allowed to be afraid of heights when the project was installed in the record time of only 4 weeks.

The logistics posed one of the biggest problems. The roof surfaces at different heights could only be reached from the ground in a few places. From there, all components had to be lifted into the airy height with a crane. This was not easy with the often strong wind at the Baltic Sea. Similarly, the statics and load-bearing capacity of the frames had to take this into account. The used M120 HC GridParity modules with 330 Wp are characterized by high stability and a low thermal coefficient.

The layout of Marek Seba, which was adapted to the roofs, led to a highly efficient but also aesthetic solution due to the optimization of the electrical losses.

The team of GridParity s.r.o. from Brno was enthusiastically involved, as was the reinforcement from Karlsfeld. The planned construction time could be reduced by 2 weeks due to the deployment.

Reference project: Terrace as Carport

One of our customers near Munich has chosen a terrace from our range and uses it as a carport. The kit fits perfectly into the customer's driveway.

A total of 10 transparent M50 double glass modules were installed. The total power of the system is 2.5 kWp.

This aesthetic roofing offers not only shading but also protection against any weather influences.

The customer was supported by our competent team on site during installation.

The picture on the right shows the enthusiastic customer (2nd from left).

Reference project: e-loading station with Carport XXL+3XL

In Hesse, a customer combined two of our larger carport kits and thus installed a public electric charging station. A total of 10 kWp was installed.

The semi-transparent double glass modules allow approx. 12% of the incident sunlight to pass through the carport, creating a pleasant ambience. So you do not park in a dark hole. The 160x80 mm aluminum profiles used provide the necessary stability. The construction remains relatively filigree for such a large span of more than 11 metres.
